Routing and Forwarding in IP Networks

No Loop Detection on Forwarding Plane

- Very high cost (packets loop through same routers until TTL runs out)
- $\Rightarrow\,$ Routing has to be perfectly <code>loop-free</code>

Routing and Forwarding in IP Networks

No Loop Detection on Forwarding Plane

- Very high cost (packets loop through same routers until TTL runs out)
- $\Rightarrow\,$ Routing has to be perfectly loop-free

Routing and Forwarding in IP Networks

No Loop Detection on Forwarding Plane

- Very high cost (packets loop through same routers until TTL runs out)
- \Rightarrow Routing has to be perfectly **loop-free**

NDN: Detect & handle loops via nonce!

Great benefits of using multiple paths at the same time!

- Load Balancing
- Gradual shifting of traffic during congestion [1, 2]
- Exploiting differences in cost and performance of paths (WiFi vs. LTE) [3]

Great benefits of using multiple paths at the same time!

- Load Balancing
- Gradual shifting of traffic during congestion [1, 2]
- Exploiting differences in cost and performance of paths (WiFi vs. LTE) [3]

Traffic Splitting requires Loop-Freeness and Path Choice

NLSR: High Path Choice, but many Loops

Loop-Free Routing: Limited Path Choice

Incoming Interface-Exclusion: Higher Path Choice

Via Routing? Too complex!

- 1. Trad: Undirected graph \Rightarrow Directed Acyclic Graph (DAG)
- Now: ⇒ Directed graph without cycles longer than one hop!

Via Routing? Too complex!

- 1. Trad: Undirected graph \Rightarrow Directed Acyclic Graph (DAG)
- Now: ⇒ Directed graph without cycles longer than one hop!

Solution:

- 1. Almost Loop-free Routing (ALR)
- 2. On-demand Loop Removal at forwarding layer

Give each nexthop in FIB a Type: { Downward, Upward, Disabled }.

- 1. Fill FIB with Downward Nexthops
- 2. If prefix still has only one nexthop:
 - Go through all disabled nexthops:
 - If NH passes **Heuristic Loop Checks**: Add as Uphill; break;

Give each nexthop in FIB a Type: { Downward, Upward, Disabled }.

- 1. Fill FIB with Downward Nexthops
- 2. If prefix still has only one nexthop:
 - Go through all disabled nexthops:
 - If NH passes **Heuristic Loop Checks**: Add as Uphill; break;

 \Rightarrow Much more nodes with at least 2 nexthops, and low looping chance.

Forwarding loop: Uphill Nexthop Removal (UNR)

Results of 8 other routing protocols in 9 topologies:

- ALR: Low computational complexity, similar to NLSR.
- UNR: Very low forwarding complexity (only 0.4% to 1.6% of FIB entries need to be changed)

Together: Completely loop-free network with **higher path choice** than loop-free routing for all tested topologies.

How to Establish Loop-Free Multipath Routes in NDN?

• Loop-free routing vs. Loop handling at Forw. Layer

How to Establish Loop-Free Multipath Routes in NDN?

• Loop-free routing vs. Loop handling at Forw. Layer

Traffic Splitting needs Loop-freeness and high Path Choice

- Loop-free routing provides former, but not latter.
- Current NDN routing vice versa.
- ⇒ Achieving both by combining Almost-Loopfree Routing with Loop-removal at the forwarding layer.
