A ranking of the largest Internet AS by the number of direct and indirect customer ASs.

Internet topology can be mapped at four levels.

1. **IP addresses** that connect devices to the Internet.
2. **Routers**, machines that route the traffic, interconnect via **IP addresses**.
3. **POPs**, geographic locations of the **routers** and servers.
4. **Autonomous Systems (AS)** are independently operated networks that route groups of **IP addresses**.

AS level graph

 702 observed paths

 8732 observed paths

Build the graph from
observed AS paths.

Router graph

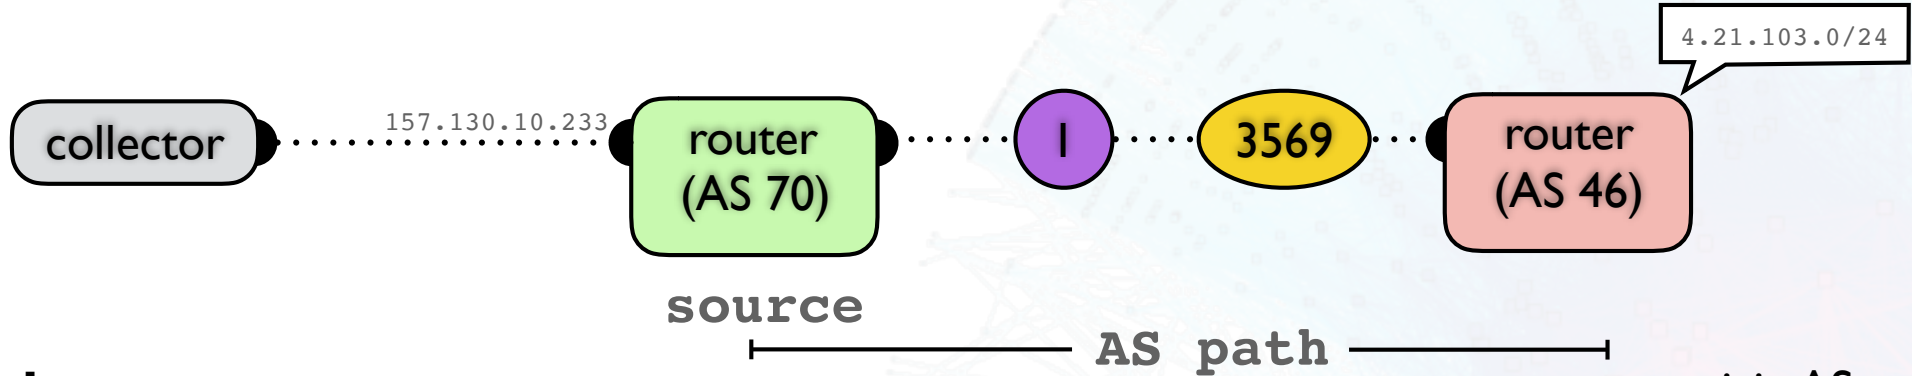

Routes are announced by routers and forwarded toward the collector. So the last AS, the “origin” AS, “owns” (first announces) the prefix.

BGP Collector

	prefix	AS path		origin AS

degree types

Based on the set of AS paths, different types of degrees may be inferred.

B's degrees

type	neighbors	degree
link based		
global	A C E D G	5
customers	A D	2
peer	E	1
providers	G	0
triplet based		
transit	A E D G	4

paths: A → B → G
B → C
E — B ← D
F → E — B ← D

Transit degree is a proxy for
the number of ASs whose
traffic can cross the AS.

AS relationships (simplified)

as-rank.caida.org

provider

- **you pay them** to transit your traffic
(XO pays AT&T)

peer

- **unpaid** exchange of traffic
(between XO and Google)

customer

- **they pay you** to transit their traffic
(UCSD pays XO)

ASes can be organized into a hierarchical structure based on the type of business relationships they form between themselves.

customer $\xrightarrow{\text{\$ \$}}$ **provider**
customer pays provider for transit

peer $\xrightarrow{\text{\$ \$}}$ **peer**
peers do not pay to accept each other's traffic

An AS's customer cone contains the set of ASs we observe the AS announce to its peers or providers. In practice, this is the set of ASs it can reach through its customers.

B	3
D	1

Customer Cones

ISPs only transit traffic if at least one side is paying for it. Customer cones are therefore inferred only from routes announced to peers and providers.

Customer cone size is a measure of influence on the global routing system.

IIJ's AS Core

as-rank.caida.org

AS Core is a visualization of the ASes' geographic location and customer cone.

AS's **angle** is set the centroid of the its BGP prefixes in Netacuity.

AS's **radius** is set by log of the inverse of their customer cone.

$$1 - \log \left(\frac{\text{number of ASes in cone} + 1}{\text{max. number of ASes in cone} + 1} \right)$$

geolocation to longitude

as-rank.caida.org

An AS's location is set to the weighted average of the locations assigned by Netacuity to the addresses it announces.

$$\frac{\sum_i \text{block}_i.\text{longitude} * \text{block}_i.\text{size}}{\sum_i \text{block}_i.\text{size}}$$

Rank API Help

This page documents the RESTful API for CAIDA's [AS Rank](#) service. Please send questions and comments to asrank-feedback@caida.org.

General

NB: Examples below may show lower default per-page count than the default of **500** (of 500 maximum).

Ordered list of ASNs

New RESTFUL API to the
AS Rank data.

- all replies are in the following wrapper:

```

**ASs at the top of the hierarchy are call Tier-I.
Together they form the backbone of the
Internet.**

We infer that the set of “Tier-I”
ASs are members of the largest
clique, fully connected set, of the
largest ASs.

path: this string contains the AS path with the gaps between ASes annotated with relationships if known

- A > B : A is a provider of B
- A < B : A is a customer of B
- A - B : A is a peer of B
- A B : A has no known relationship with B, this occurs when the link's paths or the link itself was rejected

prefixes: an array of prefixes that share the same set of monitors.

- each monitor includes its name and the peer IP address that observed this path
- a monitor can have multiple IPs, but it is not very common

- **tags:** (optional) An array of additional tags to apply to the path
 - **index** or **indexes:** single value, or array, of integers
 - **type:** "IX", "loop", "duplicate"
 - **IX** (-A-): The ASN at the index is an Internet EXchange (IX), and should be removed
 - **loop** (A-B-C-D): a loop was detected and all parts of the loop are removed from the path
 - **duplicate** (-A): removes duplicate ASNs
 - **add:** (-): (optional) value of to add
- **used:** the clean path used to infer AS Relationships

- **rejected** (optional) this signals the whole path was rejected and encodes the reason why
 - **type** reasons for path rejection
 - **poison** : a non-clique ASN was observed between two clique ASNs
 - **unassigned** : an unassigned ASN was observed in the path
 - **reserved** : a reserved "private" ASN was observed in the path
 - **index** or **indexes** location of the ASN that caused the path to be rejected
