

Residential Links Under the Weather

Ramakrishna Padmanabhan

Aaron Schulman

UC San Diego

Dave Levin, Neil Spring

8 years: Less hair, more wisdom (and a couple of PhDs)

We know how the Internet is affected by
cataclysmic weather events

A dark, atmospheric night photograph of a city street. Tall buildings line both sides of the street, their windows glowing with light. The wet pavement reflects the streetlights and building lights, creating a shimmering effect. The sky is a deep, dark blue. The overall mood is somber and mysterious.

Government regulators mandate reporting of
large-scale failures

But what about the **far more common** weather events?

⚡ Lightning

Destroys equipment;
causes outages

⚡ Lightning

Destroys equipment;
causes outages

≡ Wind

Knocks down trees
onto wires

⚡ Lightning

Destroys equipment;
causes outages

≡ Wind

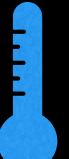

Knocks down trees
onto wires

❄ Snow

Weights down wires;
attenuates wireless signals

Quantifying weather's effect on residential Internet

...  Cold  Heat  Lightning  Wind  Snow  Rain ...

Weather affects the most common links people use to get on the Internet

Data

Ping residential links
before, during, and
after weather events

Challenges

Outages are rare and
may be unrelated to
weather events

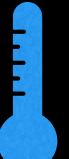

Analysis

Use tools from
epidemiology to
analyze rare events

Results

Weather effects
depend on intensity,
geography, and link

Quantifying weather's effect on residential Internet

Quantifying weather's effect requires collecting data...

Everywhere

Weather is localized

Affects a specific region

Over long periods of time

Weather is seasonal

Some conditions only
happen in certain months

Across all link types

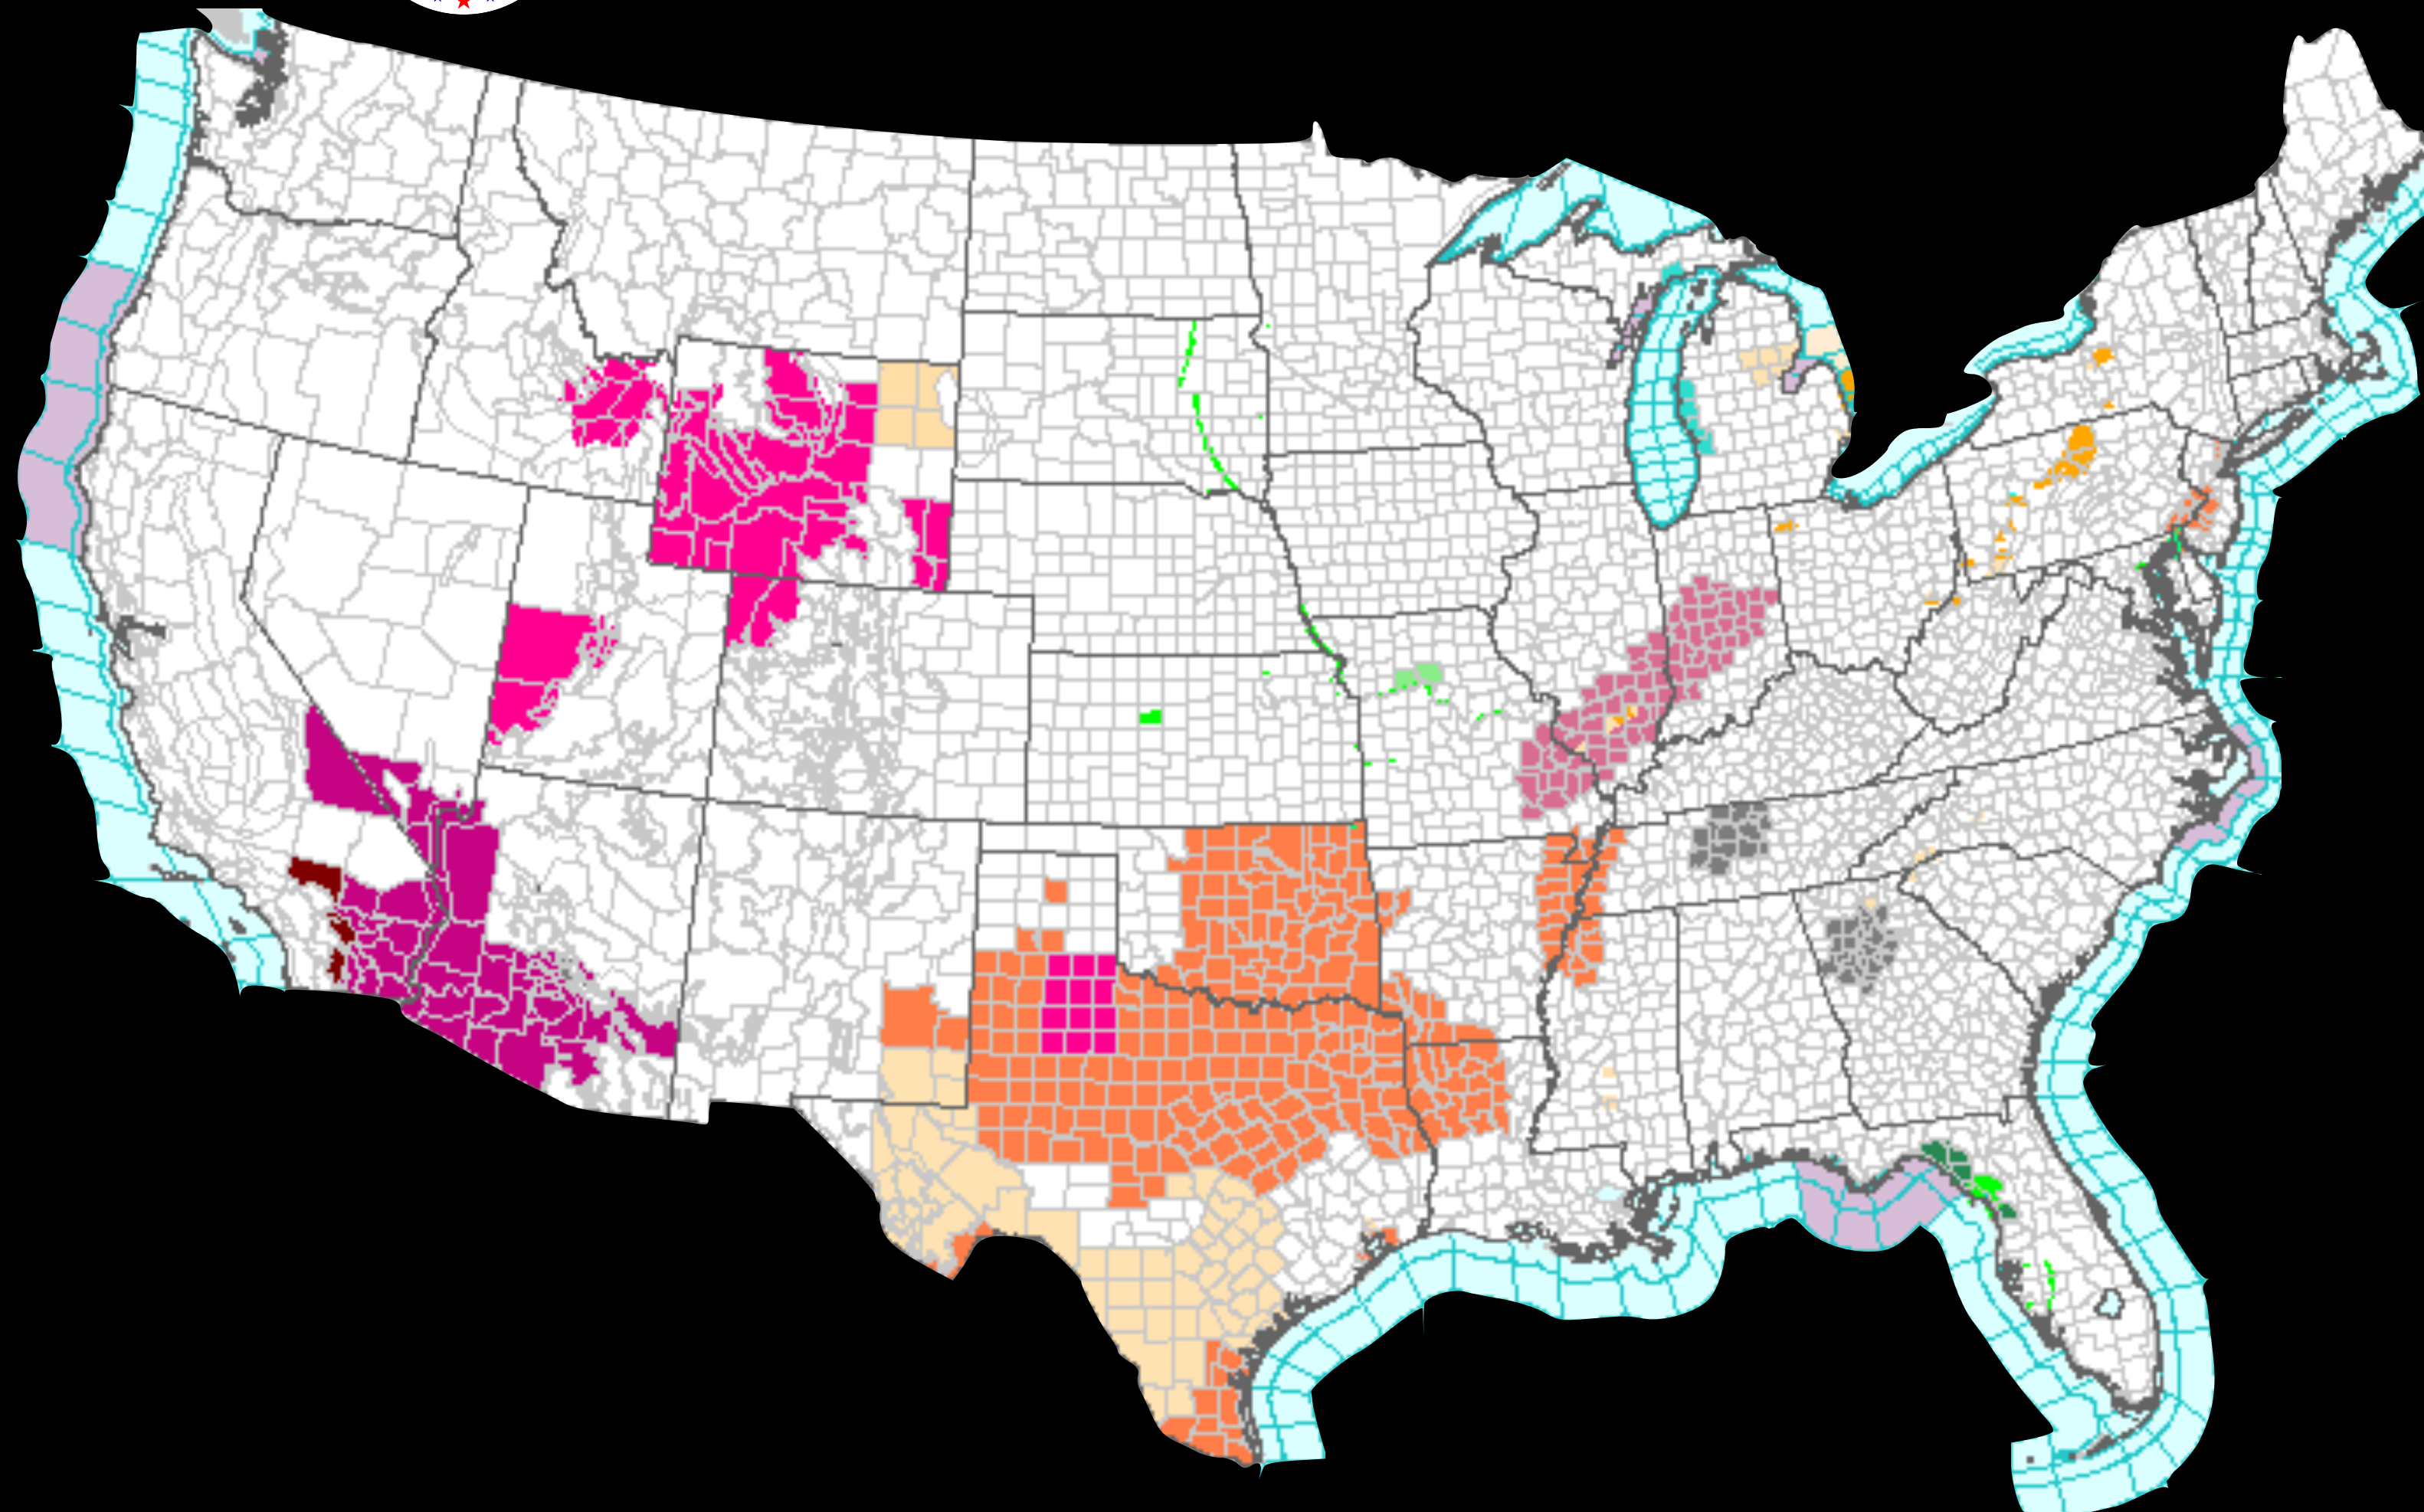

Links are heterogeneous

Variety of technologies,
vendors, installations

Storm-chasing with Thunderping

[IMC '16]**

User/ISP behavior

Weather-related Internet outages

Challenges in quantifying weather-related outages

Goal: Attribute a dropout to an *outage*

Dropouts have many causes

Responses arriving after timeouts

Very rare in the U.S.
[IMC '15]

Dynamic addressing

Common for some link types
[IMC '16]

User/ISP behavior

Internet outages

Goal: Compare weather events, link types, regions, ...

Dropouts are rare

An additional dropout can significantly affect an estimate of its probability

	Fiber	Cable
Avg. # of days between dropouts	35	22

Comparing rare events

1

We apply statistical techniques from epidemiology to determine **how long we need to observe rare events**

95% confidence

1 dropout-hour per month
requires 7205 samples

Comparing rare events

2

We factor out non-weather sources of dropouts by **subtracting a baseline dropout probability**

Comparing rare events

2

We factor out non-weather sources of dropouts by **subtracting a baseline dropout probability**

Comparing rare events

2

We factor out common sources of outages by **subtracting a baseline dropout probability**

Comparing rare events

2

We factor out common sources of outages by **subtracting a baseline dropout probability**

Comparing rare events

Businesses

Can estimate revenue loss due to everyday weather

Governments

Can identify problem areas and guide investment

Customers

Can learn about the resilience of ISPs in their area to weather

We quantified weather's effect on Internet connectivity

Link type

Wireless link types experience more outages during precipitation

Wired link types experience more outages in gale-force conditions

Geography

Midwestern states are more affected by rain

Southern states are more affected by snow

Intensity

Wind, precipitation, and temperature, have non-linear effects on connectivity
